

Question a.

Code: `ggplot(heart_tbl, aes(x=Age, y=RestingBP, col=Sex)) + geom_line()`

Looking at the line plot, it seems like there is no difference in distribution of the restingBP across the Sexes. The restingBP follows a similar trend across ages for both the sexes, with very few anomalies. The only thing that could be mentioned is that males have a higher variance in their restingBP compared to females.
